Solid Carbide

Genre	Platform	Playtime	Style	Engine
Roguelite driving-survival	PC (Windows)	8 minutes per run	2D isometric pixel art, retro neon cyberpunk	Godot 4

Pitch

In one sentence: *Solid Carbide* is a driving roguelite where you survive by out-drifting monsters for a livestream audience that rewards you with weapons.

In one paragraph: Monsters have overrun Crash City, and the energy-drink brand Redgull has sent its sponsored Stunt Driver in, not to help, but to drift for the cameras. Every run is livestreamed. Holding long drifts and chaining tricks earns likes; filling the likes bar levels you up and Redgull drops you a gift pack: a new weapon or an upgrade. Your weapons fire on their own, so you only ever drive. Monsters swarm in and drop coins, which buy permanent car upgrades in the garage between runs. At the 7-minute mark a Godzilla-style kaiju arrives, raining meteors, and your weapons have one minute to bring it down. One minute, one kaiju, one skill: drifting.

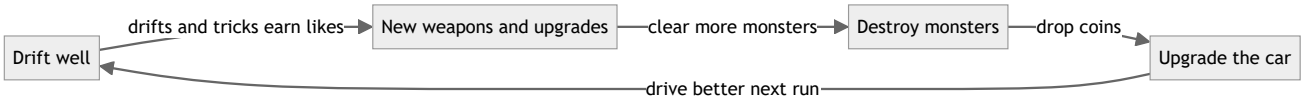

The world and the tone

Humanitarian crises are breaking out around the world, and Redgull sends its stunt driver to each disaster zone, one city per level. The first is Crash City and its kaiju.

The tone is **satirical**. Redgull isn't evil, just completely out of touch: obsessed with its brand, its feed and its numbers. The game is fun to play, but the player should sense that what they're doing is slightly unethical, and it says so whenever it can. Players never see "XP": they see **likes**, and the rewards arrive as Redgull **gift packs**. Redgull also funds the car's upgrades, all in service of the sponsorship.

Design pillars

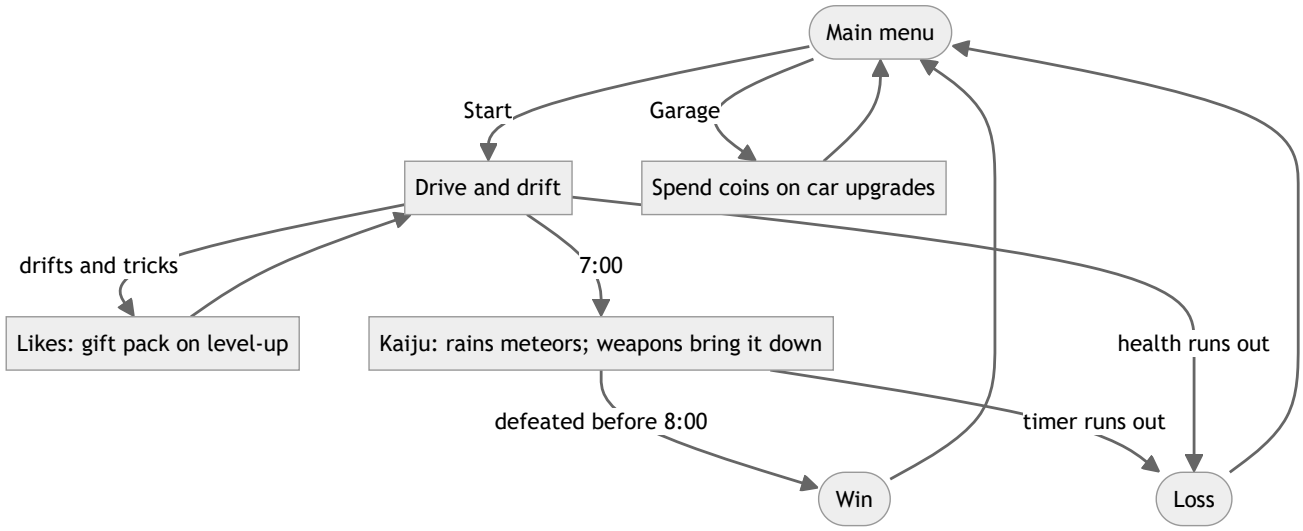

- **Drift feel is king.** The car's handling copies a drift prototype the designer is happy with, and it is tuned by playing it before any final art exists.
- **Drive to get stronger.** Likes, and so new weapons, come only from driving: drifts and tricks. Never from kills.
- **Destroy to upgrade the car.** Monsters drop coins; coins buy permanent upgrades in the garage. Kills never give likes.

The game

A run lasts 8 minutes. The player starts at the main menu (Start, Garage, Quit) and returns there after every run, win or loss.

- **Driving:** W drives forward, S brakes and reverses, A and D steer and drift. The car jumps straight to a cruising speed and builds a long, fast slide when turned, which carries more speed than driving straight.
- **Obstacles:** crashed meteor boulders stand on the roads in set patterns, to drift around and bounce off.
- **Tricks and the combo:** extended drifts, 360s and alternate drifts (switching between forward and backward drifts) are tricks. Each one raises a combo multiplier on every like earned, and pops its name out from the car in comic-style letters. Hitting anything cuts the combo, and it drains if the tricks stop. A higher combo also draws more monsters.
- **Likes and gift packs:** drifts longer than a second earn likes every second, multiplied by the combo. Each time the likes bar fills, a Redgull helicopter flies over and drops a gift pack; driving over it pauses the game for the gift pack: a choice of two weapons or upgrades. The first is always the exhaust flamethrower or a gun upgrade.
- **Weapons:** the car starts every run with a **gun** that aims and fires on its own at monsters in range. The second weapon is a **flamethrower out of the exhaust that fires only while drifting**. The weapons reset every run.
- **Monsters:** light-green, four-legged lizards come in from the edges of the screen, a few more as the run goes on. They hurt the car on contact and drop coins.
- **The kaiju:** at 7:00 a Godzilla-style kaiju arrives and walks slowly towards the car. Weapons can damage it at any time. It rains meteors (a red warning circle shows where they will land) that leave new boulders on the roads.
- **Winning and losing:** defeat the kaiju before 8:00 to win. The run is lost if the car's health runs out or the kaiju survives the timer.
- **The garage:** between runs, coins buy permanent upgrades, about 10 levels each: acceleration, car health and a weapon damage bonus.

Player experience

The player only drives; everything else reacts. The screen shows the car's health, a timer counting down from 8:00, the likes bar and level, the coins collected, the combo, and the kaiju's health once it arrives. Escape pauses the game.

The map is one city: 240 by 240 units (one unit is a car's width), a 4 by 4 grid of big city blocks with wide roads between them, a wide road around the edge and an open gravel square in the middle. The car bounces off buildings and boulders, and buildings turn see-through when the car drives behind them.

The look

Night in a Tokyo-style cyberpunk city: dark navy and purple, lit by pink and cyan neon, with vertical signs and lit windows over cracked asphalt. Redgull's logo is a minimal side profile of a seagull's head in a single dark red, slightly evil and unsettling, and the company's red shows up only on its own things, such as the weapons it sends; the city itself is not Redgull's. The car is a dark-green, late-sixties fastback muscle car with two white stripes. All art is hard-edged, retro pixel art in a 3/4 isometric view, with a dark outline, detailed shading, glow drawn into the pixels and no blur. Real cars and monsters are only inspiration: no real logos, no copies of existing characters.

The MVP, and what comes after

	MVP	**After the MVP**
Weapons	2: the gun and the exhaust flamethrower	8 to 12, three offered per gift pack
Bosses	the kaiju in Crash City	a different monster boss for each city
Map	one city, made once	more cities, one per level (how maps are made is still open)
Challenges	none: boulders are plain obstacles	driving challenges marked by painted arrows, maybe
Garage	3 upgrades, a plain list	more upgrades, unlockable cars
Players	single player	local co-op for 2 or 4, split screen
Screens	plain menus	a run recap, a full pause menu, styled screens

How it's made

Solid Carbide is built by a small studio of AI agents run with Claude Code. The designer is the board, and the **Project Lead** turns the board's requests into task files and keeps the documents in sync. Eleven specialist agents build the game: driving and drift, enemies, weapons, the run itself, game data, the map and challenges, the UI, pixel art (generated through PixelLab), sound effects (music is made by a human), the story's tone, and QA, which checks every task before the board plays it. No AI runs inside the shipped game.

Every decision lives in one of the game area documents, the long GDD is generated from them, and this short GDD condenses the long one.
