

Solid Carbide - Final GDD

Genre	Platform	Playtime	Style	Engine
Roguelite driving-survival	PC (Windows)	8 min/run	2D isometric pixel art, neon cyberpunk	Godot 4

Pitch

One sentence: *Solid Carbide* is a driving roguelite where you survive by out-drifting enemies and completing driving challenges to become stronger.

One paragraph: *Solid Carbide* is a 2D isometric roguelite set in a neon cyberpunk city under attack by kaiju-scale monsters, where the player has to drive to survive. The player earns weapons for the car mid-run only by driving well: completing driving challenges scattered across the rubble-strewn streets and racking up drift time. Kaiju minions swarm the player, and the only way to survive is to drift around them while accumulating XP to get more powerful weapons — better weapons mean keeping the minions at bay. Enemies drop currency which can be used between runs to permanently upgrade the car, making future runs more likely to succeed. Every run ends with a kaiju spawning at the 7-minute mark, vulnerable only through completing more driving challenges, with 60 seconds to take it down. A roguelite loop built entirely around one single core skill: drifting.

Narrative Theme

Crash City has been overrun by monsters, endangering civilians and wrecking its infrastructure. The player is "Stunt Driver," sent in by energy-drink sponsor Greenbull to show off their driving skills amid the chaos. Greenbull rewards good driving with "gift packs" — the in-run weapon drops — and funds the car's upgrades between runs, all in service of the sponsorship.

Inspired By

Vampire Survivors, Hades, Super Arcade Racing, Art of Rally, Absolute Drift

Design Pillars

Driving skill, not combat, powers every system

A self-reinforcing loop that rewards drifting

Three candidate curves for the drift-intensity curve

Game Specificity

Solid Carbide is an isometric drift-racing roguelite. The player drives a single car through one neon cyberpunk city under kaiju attack, auto-firing weapons at monster minions while chasing driving challenges — obstacle courses marked by an on-ground indicator line — to earn XP and level up weapons. Every run is 8 minutes: at the 7-minute mark a kaiju spawns and moves slowly toward the player, dealing contact damage. It's invulnerable by default; challenges keep spawning near it, and completing one opens a timed vulnerability window for the player's weapons to damage it — the moment that challenge is done, a new one spawns so the chain continues.

Every run is one loop: drive, earn XP, upgrade, race the clock

Win: defeat the kaiju within the final 60 seconds. **Loss:** the car's HP reaches 0 at any point, or the kaiju survives the timer.

Between runs, coins earned from defeated enemies can be spent in the Garage menu to buy permanent upgrades for the car — this improves driving performance in the next run, allowing the player to come closer to defeating the boss.

Player Experience

The player only ever drives — W to go forward, A/D to steer and drift. Everything else on screen reacts to that: holding a turn longer makes the car slide further, an arrow near the car always points toward the closest challenge to try next, and completing a challenge flashes a score and pops open a weapon menu. Enemies close in from the edges of the screen and the car's weapons handle them automatically, so the player's attention stays on the road, not on aiming. As the run goes on, more enemies show up and each is tougher to shrug off, so pressure builds toward the kaiju fight.

AI Development Pipeline

Eleven agents, run via Claude Code, work like a small studio team — the user is the board, the Orchestrator is the studio's day-to-day lead, and every other agent has one specific job. No AI runs inside the shipped game itself.

Agent	What it does
Project Lead	Takes the user's requests, checks what's feasible, delegates work to the right agent, keeps a running task board, and comes back with a suggested priority order
Driving & Drift Agent	Writes the Godot code for the car's driving and drift-curve physics, working directly with the user's manual playtesting to tune the feel
Enemy Behavior Agent	Writes the Godot code for how enemies spawn, move, and scale in number and difficulty over a run
Weapon Behavior Agent	Writes the Godot code for how each weapon actually fires and behaves in-game
Game Data Agent	Writes the stats and upgrade paths for weapons, enemies, and garage car upgrades as structured data the other code agents read
Level/Challenge Design Agent	Builds the one map and its driving challenges
UI Agent	Builds the HUD, menus, and the garage screen where car upgrades are bought

Agent	What it does
Asset Generation Agent	Generates the neon cyberpunk pixel art automatically via PixelLab's API
SFX Agent	Finds, downloads, and integrates royalty-free sound effects (drift, weapons, impacts, UI); music comes from a human musician, not an agent
Narrative Theme Agent	Keeps any dialog, text, or flavor content other agents produce consistent with the Crash City / Stunt Driver / Greenbull story
QA/Integration Agent	Checks that everything the other agents made actually runs together before it reaches a playtest

Technical Feasibility

Engine: Godot 4 — free, native 2D tooling, GDScript simple enough for agents to generate reliably.

Constraints:

- 5-week window (Sep 25 – Nov 4) caps scope to one car, one map, one minion enemy type plus the kaiju, and 3 driving-challenge types. Weapons capped at 3 total (2 offered per level-up), each upgradeable up to 20 times, changing damage, projectile quantity/size, or attack speed.
- Claude Pro's usage limits cap prompting within a rolling window, risking a stalled agent chain — mitigated by staying present during multi-agent sessions to monitor and manage it.

Budget:

Item	Assumption	Cost
Claude Pro	Flat monthly fee, 2 billing cycles over the project window	~\$40
PixelLab (Tier 2 "Pixel Artisan")	\$24/month, 2 billing cycles	~\$48

Item	Assumption	Cost
Total		~\$88, against a \$100 soft target and a \$200 hard cap
